

IN THE CLAIMS

1. (Currently Amended) A method of forming a transistor, comprising:  
forming a gate dielectric layer on a semiconductor substrate;  
forming a first conductivity type semiconductor layer on top of the gate dielectric layer;  
selectively removing a portion of the first conductivity type semiconductor layer to  
expose the gate dielectric, the portion defining a first conductivity type well region;  
forming a first conductivity type semiconductor well in the first conductivity type well  
region, the first conductivity well region being located over a portion of a single second  
conductivity type semiconductor well, wherein the second conductivity type semiconductor well  
is sized to accommodate at least one transistor outside the first conductivity well portion;  
modifying the gate dielectric layer in the first conductivity type well region, the modified  
gate dielectric being adapted for operation with a second conductivity type gate material;  
depositing a second conductivity type semiconductor material on the modified gate  
dielectric layer and forming a second conductivity type gate from the second conductivity type  
semiconductor layer; and  
forming source/drain regions adjacent the gate.
2. (Original) The method of claim 1, wherein forming a first conductivity type  
semiconductor well comprises implanting a first conductivity type well through the gate  
dielectric layer.
3. (Original) The method of claim 1, wherein the first conductivity type semiconductor  
layer is formed in-situ.
4. (Original) The method of claim 1, wherein the second conductivity type semiconductor  
layer is formed in-situ.

5. (Original) The method of claim 1, wherein a single mask is used for selectively removing a portion of the first conductivity type semiconductor layer; forming a first conductivity type semiconductor well; and depositing a second conductivity type semiconductor material on the gate dielectric.

6. (Currently Amended) A method of forming a transistor, comprising:  
forming a first gate dielectric layer on a semiconductor substrate;  
forming a first conductivity type semiconductor layer on top of the first gate dielectric layer;  
selectively removing a portion of the first conductivity type semiconductor layer to expose the first gate dielectric, the portion defining a first conductivity type well region;  
forming a first conductivity type semiconductor well in the first conductivity type well region, the first conductivity well region being located over a portion of a single second conductivity type semiconductor well, wherein the second conductivity type semiconductor well is sized to accommodate at least one transistor outside the first conductivity well portion;  
removing the first gate dielectric layer in the first conductivity type well region to expose a portion of the first conductivity type semiconductor well;  
forming a second gate dielectric layer over the exposed portion of the first conductivity type semiconductor well, the second gate dielectric layer being adapted for operation with a second conductivity type gate material;  
depositing a second conductivity type semiconductor material on the second gate dielectric layer and forming a second conductivity type gate from the second conductivity type semiconductor layer; and  
forming source/drain regions adjacent the gate.

7. (Original) The method of claim 6, wherein forming a first conductivity type semiconductor well comprises implanting a first conductivity type well through the first gate dielectric layer, before removing the first gate dielectric layer.

8. (Original) The method of claim 6, further comprising coupling a hardened dielectric layer to the second gate dielectric layer.
9. (Original) The method of claim 6, wherein the second gate dielectric layer differs in thickness from the first gate dielectric layer.
10. (Original) The method of claim 6, wherein the first conductivity type semiconductor layer is formed in-situ.
11. (Original) The method of claim 6, wherein the second conductivity type semiconductor layer is formed in-situ.
12. (Original) The method of claim 6, wherein a single mask is used for selectively removing a portion of the first conductivity type semiconductor layer; forming a first conductivity type semiconductor well; removing the first gate dielectric layer; and depositing a second conductivity type semiconductor material on the second gate dielectric layer.
13. (Currently Amended) A method of forming pair of transistors, comprising:
  - forming a second conductivity type semiconductor well in a semiconductor substrate using a single mask;
  - forming a gate dielectric layer on the semiconductor substrate;
  - forming a first conductivity type semiconductor layer on top of the gate dielectric layer, over the second conductivity type semiconductor well;
  - selectively removing a portion of the first conductivity type semiconductor layer to expose the gate dielectric layer, the portion defining a first conductivity type well region;
  - forming a first conductivity type semiconductor well in the first conductivity type well region, the first conductivity well region being located over a portion of the second conductivity type semiconductor well;
  - modifying the gate dielectric layer in the first conductivity type well region, the modified gate dielectric being adapted for operation with a second conductivity type gate material;

depositing a second conductivity type semiconductor layer on the modified gate dielectric layer;

patterning and forming gates wherein a first gate is formed over the first conductivity type semiconductor well, and a second gate is formed over a remaining portion of the second conductivity type semiconductor well; and

forming source/drain regions adjacent the gates.

14. (Original) The method of claim 13, wherein forming a second conductivity type semiconductor well comprises implanting a second conductivity type well through the gate dielectric layer.

15. (Original) The method of claim 13, wherein the first conductivity type semiconductor layer is formed in-situ.

16. (Original) The method of claim 13, wherein the second conductivity type semiconductor layer is formed in-situ.

17. (Original) The method of claim 13, wherein a single mask is used for selectively removing a portion of the first conductivity type semiconductor layer; forming a first conductivity type semiconductor well; and depositing a second conductivity type semiconductor layer.

18. (Currently Amended) A method of forming a pair of transistors, comprising:  
forming a second conductivity type semiconductor well in a semiconductor substrate  
using a single mask;

forming a first gate dielectric layer on the semiconductor substrate;

forming a first conductivity type semiconductor layer on top of the first gate dielectric layer, over the second conductivity type semiconductor well;

selectively removing a portion of the first conductivity type semiconductor layer to expose the first gate dielectric, the portion defining a first conductivity type well region;

forming a first conductivity type semiconductor well in the first conductivity type well region, the first conductivity well region being located over a portion of the second conductivity type semiconductor well;

removing the first gate dielectric layer in the first conductivity type well region to expose a portion of the first conductivity type semiconductor well;

forming a second gate dielectric layer over the exposed portion of the first conductivity type semiconductor well, the second gate dielectric layer being adapted for operation with a second conductivity type gate material;

depositing a second conductivity type semiconductor layer on the second gate dielectric layer;

patterning and forming gates wherein a first gate is formed over the first conductivity type semiconductor well, and a second gate is formed over a remaining portion of the second conductivity type semiconductor well; and

forming source/drain regions adjacent the gates.

19. (Original) The method of claim 18, wherein forming a first conductivity type semiconductor well comprises implanting a first conductivity type well through the first gate dielectric layer, before removing the first gate dielectric layer.

20. (Original) The method of claim 18, further comprising coupling a hardened dielectric layer to the second gate dielectric.

21. (Original) The method of claim 18, wherein the second gate dielectric differs in thickness from the first gate dielectric.

22. (Original) The method of claim 18, wherein the first conductivity type semiconductor layer is formed in-situ.

23. (Original) The method of claim 18, wherein the second conductivity type semiconductor layer is formed in-situ.

24. (Original) The method of claim 18, wherein a single mask is used for selectively removing a portion of the first conductivity type semiconductor layer; forming a first conductivity type semiconductor well; removing the first gate dielectric layer; and depositing a second conductivity type semiconductor material on the second gate dielectric layer.
25. (Withdrawn) A method of forming a semiconductor memory device, comprising:  
forming at least one memory array;  
forming a number of wordlines coupled to the memory array;  
forming a number of bitlines coupled to the memory array;  
forming at least one transistor coupled to the memory array comprising:  
forming a gate dielectric layer on a semiconductor substrate;  
forming a first conductivity type semiconductor layer on top of the gate dielectric layer;  
selectively removing a portion of the first conductivity type semiconductor layer to expose the gate dielectric, the portion defining a first conductivity type well region;  
forming a first conductivity type semiconductor well in the first conductivity type well region, the first conductivity well region being located over a portion of a single second conductivity type semiconductor well, wherein the second conductivity type semiconductor well is sized to accommodate at least one transistor outside the first conductivity well portion;  
depositing a second conductivity type semiconductor material on the gate dielectric layer and forming a first conductivity type gate from the first conductivity type semiconductor layer; and  
forming source/drain regions adjacent the gate.
26. (Withdrawn) The method of claim 25, wherein forming a first conductivity type semiconductor well comprises implanting a first conductivity type well through the gate dielectric layer.

27. (Withdrawn) The method of claim 25, wherein the first conductivity type semiconductor layer is formed in-situ.
28. (Withdrawn) The method of claim 25, wherein the second conductivity type semiconductor layer is formed in-situ.
29. (Withdrawn) The method of claim 25, wherein a single mask is used for selectively removing a portion of the first conductivity type semiconductor layer; forming a first conductivity type semiconductor well; and depositing a second conductivity type semiconductor material on the gate dielectric.
30. (Withdrawn) A method of forming a semiconductor memory device, comprising:  
forming at least one memory array;  
forming a number of wordlines coupled to the memory array;  
forming a number of bitlines coupled to the memory array;  
forming at least one transistor coupled to the memory array comprising:  
forming a first gate dielectric layer on a semiconductor substrate;  
forming a first conductivity type semiconductor layer on top of the first gate dielectric layer;  
selectively removing a portion of the first conductivity type semiconductor layer to expose the first gate dielectric, the portion defining a first conductivity type well region;  
forming a first conductivity type semiconductor well in the first conductivity type well region, the first conductivity well region being located over a portion of a single second conductivity type semiconductor well, wherein the second conductivity type semiconductor well is sized to accommodate at least one transistor outside the first conductivity well portion;

- 
- removing the first gate dielectric layer in the first conductivity type well region to expose a portion of the first conductivity type semiconductor well;
- forming a second gate dielectric layer over the exposed portion of the first conductivity type semiconductor well;
- depositing a second conductivity type semiconductor material on the second gate dielectric layer and forming a first conductivity type gate from the first conductivity type semiconductor layer; and
- forming source/drain regions adjacent the gate.
31. (Withdrawn) The method of claim 30, wherein forming a first conductivity type semiconductor well comprises implanting a first conductivity type well through the first gate dielectric layer, before removing the first gate dielectric layer.
32. (Withdrawn) The method of claim 30, further comprising coupling a hardened dielectric layer to the second gate dielectric layer.
33. (Withdrawn) The method of claim 30, wherein the second gate dielectric layer differs in thickness from the first gate dielectric layer.
34. (Withdrawn) The method of claim 30, wherein the first conductivity type semiconductor layer is formed in-situ.
35. (Withdrawn) The method of claim 30, wherein the second conductivity type semiconductor layer is formed in-situ.
36. (Withdrawn) The method of claim 30, wherein a single mask is used for selectively removing a portion of the first conductivity type semiconductor layer; forming a first conductivity type semiconductor well; removing the first gate dielectric layer; and depositing a second conductivity type semiconductor material on the second gate dielectric layer.

37. (Withdrawn) A method of forming a semiconductor memory device, comprising:
- forming at least one memory array;
  - forming a number of wordlines coupled to the memory array;
  - forming a number of bitlines coupled to the memory array;
  - forming a pair of transistors coupled to the memory array comprising:
    - forming a second conductivity type semiconductor well in a semiconductor substrate using a single mask;
    - forming a gate dielectric layer on the semiconductor substrate;
    - forming a first conductivity type semiconductor layer on top of the gate dielectric layer, over a portion of the second conductivity type semiconductor well;
    - selectively removing a portion of the first conductivity type semiconductor layer to expose the gate dielectric, the portion defining a first conductivity type well region;
    - forming a first conductivity type semiconductor well in the first conductivity type well region;
    - depositing a second conductivity type semiconductor layer on the gate dielectric layer;
    - patterning and forming gates from the first conductivity type semiconductor layer and the second conductivity type semiconductor layer, wherein a first gate is formed over the first conductivity type semiconductor well, and a second gate is formed over a remaining portion of the second conductivity type semiconductor well; and
    - forming source/drain regions adjacent the gates.
38. (Withdrawn) The method of claim 37, wherein forming a first conductivity type semiconductor well comprises implanting a first conductivity type well through the gate dielectric layer.
39. (Withdrawn) The method of claim 37, wherein the first conductivity type semiconductor layer is formed in-situ.

40. (Withdrawn) The method of claim 37, wherein the second conductivity type semiconductor layer is formed in-situ.
41. (Withdrawn) The method of claim 37, wherein a single mask is used for selectively removing a portion of the first conductivity type semiconductor layer; forming a first conductivity type semiconductor well; and depositing a second conductivity type semiconductor layer.
42. (Withdrawn) A method of forming a semiconductor memory device, comprising:  
forming at least one memory array;  
forming a number of wordlines coupled to the memory array;  
forming a number of bitlines coupled to the memory array;  
forming a pair of transistors coupled to the memory array comprising:  
forming a second conductivity type semiconductor well in a semiconductor substrate using a single mask;  
forming a first gate dielectric layer on the semiconductor substrate;  
forming a first conductivity type semiconductor layer on top of the first gate dielectric layer, over a portion of the second conductivity type semiconductor well;  
selectively removing a portion of the first conductivity type semiconductor layer to expose the first gate dielectric, the portion defining a first conductivity type well region;  
forming a first conductivity type semiconductor well in the first conductivity type well region;  
removing the first gate dielectric layer in the first conductivity type well region to expose a portion of the first conductivity type semiconductor well;  
forming a second gate dielectric layer over the exposed portion of the first conductivity type semiconductor well;  
depositing a second conductivity type semiconductor layer on the second gate dielectric layer;  
patterning and forming gates from the first conductivity type semiconductor layer and the second conductivity type semiconductor layer, wherein a first gate is formed over the

first conductivity type semiconductor well, and a second gate is formed over a remaining portion of the second conductivity type semiconductor well; and

forming source/drain regions adjacent the gates.

43. (Withdrawn) The method of claim 42, wherein forming a first conductivity type semiconductor well comprises implanting a first conductivity type well through the first gate dielectric layer, before removing the first gate dielectric layer.
44. (Withdrawn) The method of claim 42, further comprising coupling a hardened dielectric layer to the second gate dielectric layer.
45. (Withdrawn) The method of claim 42, wherein the second gate dielectric layer differs in thickness from the first gate dielectric layer.
46. (Withdrawn) The method of claim 42, wherein the first conductivity type semiconductor layer is formed in-situ.
47. (Withdrawn) The method of claim 42, wherein the second conductivity type semiconductor layer is formed in-situ.
48. (Withdrawn) The method of claim 42, wherein a single mask is used for selectively removing a portion of the first conductivity type semiconductor layer; forming a first conductivity type semiconductor well; removing the first gate dielectric layer; and depositing a second conductivity type semiconductor material on the second gate dielectric layer.
